

SI 388 Memory Retention & Retrieval

WEEK 9-1 (MON 30 OCT)

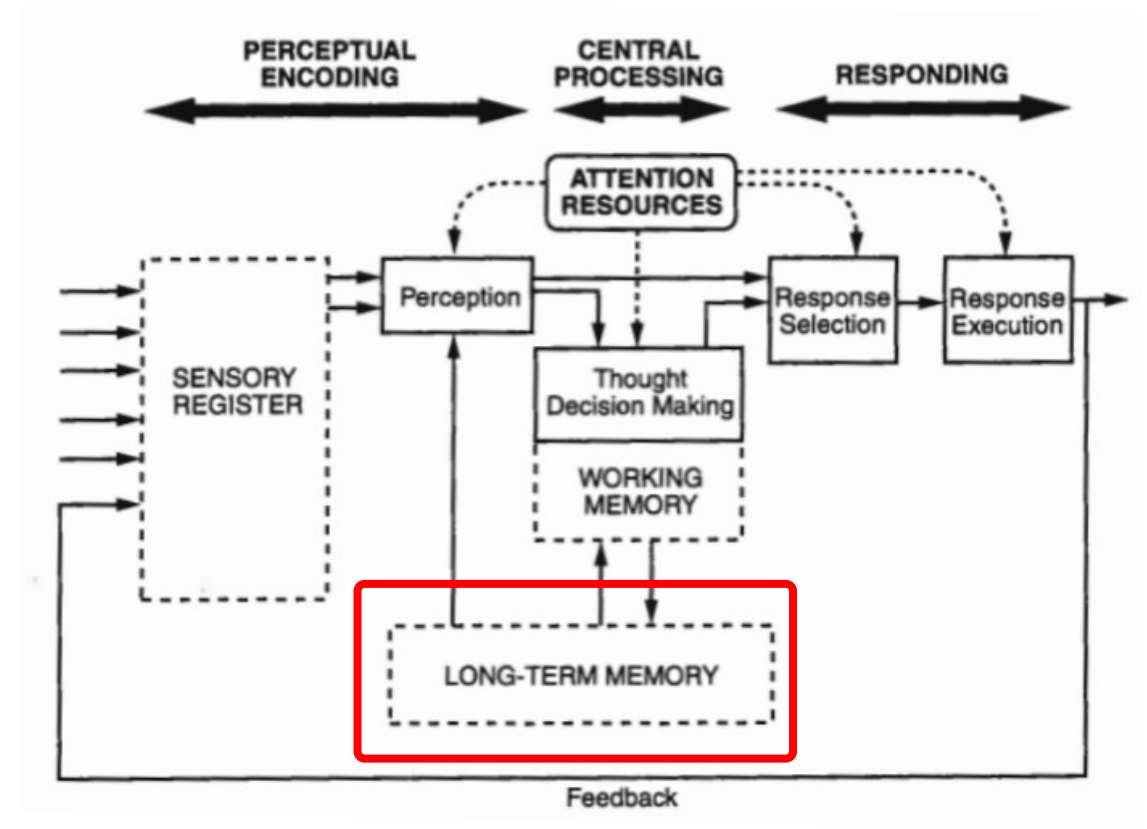

MARK THOMPSON-KOLAR, MSI, MA

Agenda for Today

- ❑ TAC presentations by Groups 11 & 12
 - ❑ Feedback links in Announcements
- ❑ Wrap up / High points on Long-term Memory
- ❑ Lesson: Mental representations and problem solving

Wrap-up on Long-term Memory

- More on Long-term Memory
 - Factors in forgetting
 - Recall vs. recognition
 - Several implications on design

How Memory Retention Works: Time

- ❑ Memory systematically degrades with time (**Decay theory of forgetting**).
- ❑ What can be recalled from LTM drops off quickly and then rate of change decreases
- ❑ Follows a logarithmic function called **Power Law of Forgetting**
- ❑ Curve varies by:
 - ❑ Type of information
 - ❑ Strength of original memories
 - ❑ Emotional component

How Retention Works: Interference

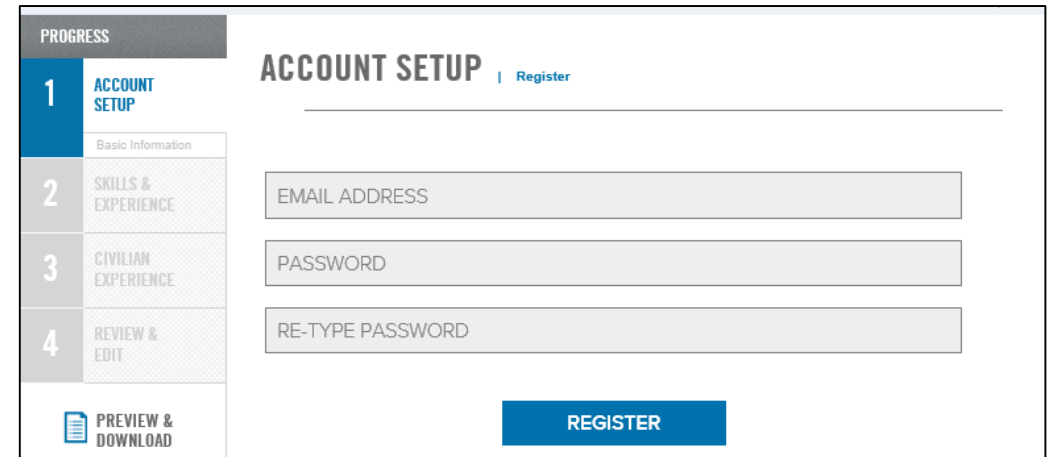

- ❑ Interfering material can degrade memory retention.
- ❑ Commonly called **Interference**.
- ❑ People experience information ... then other, similar information → blurs together.

Redundancy Reduces Interference

□ Interference is **decreased** when additional, related information is supplied with the initial information.

Has impacts in training/onboarding, where it's effective to provide multiple similar messages.

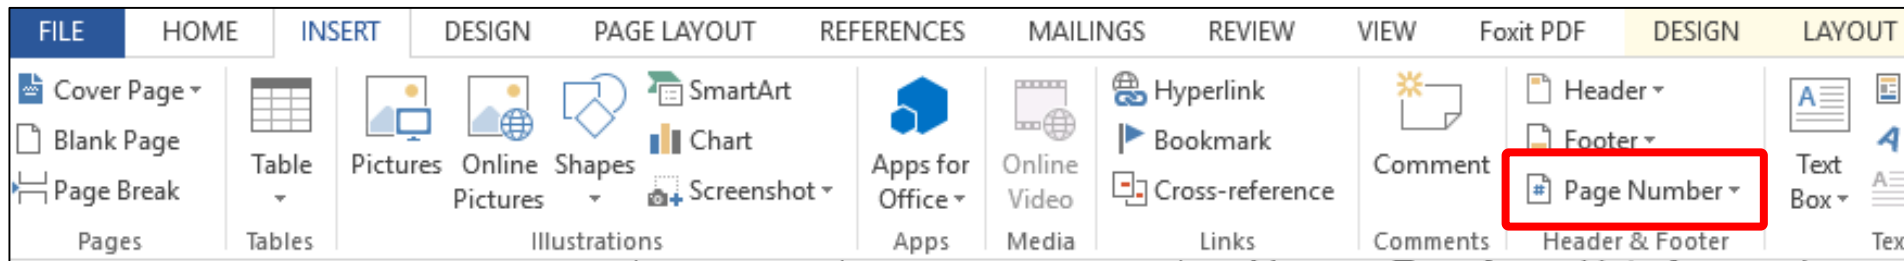

This site provides a preview screen for what the steps are.

Then there is a progress indicator that offers similar info.

Repetition helps reduce Interference.

How Retention Works: Interference

- ❑ Pre-existing memories also can cause Interference.
- ❑ Previous similar procedural memories can supplant newly remembered info.

Recognition, Recall, and Retrieval

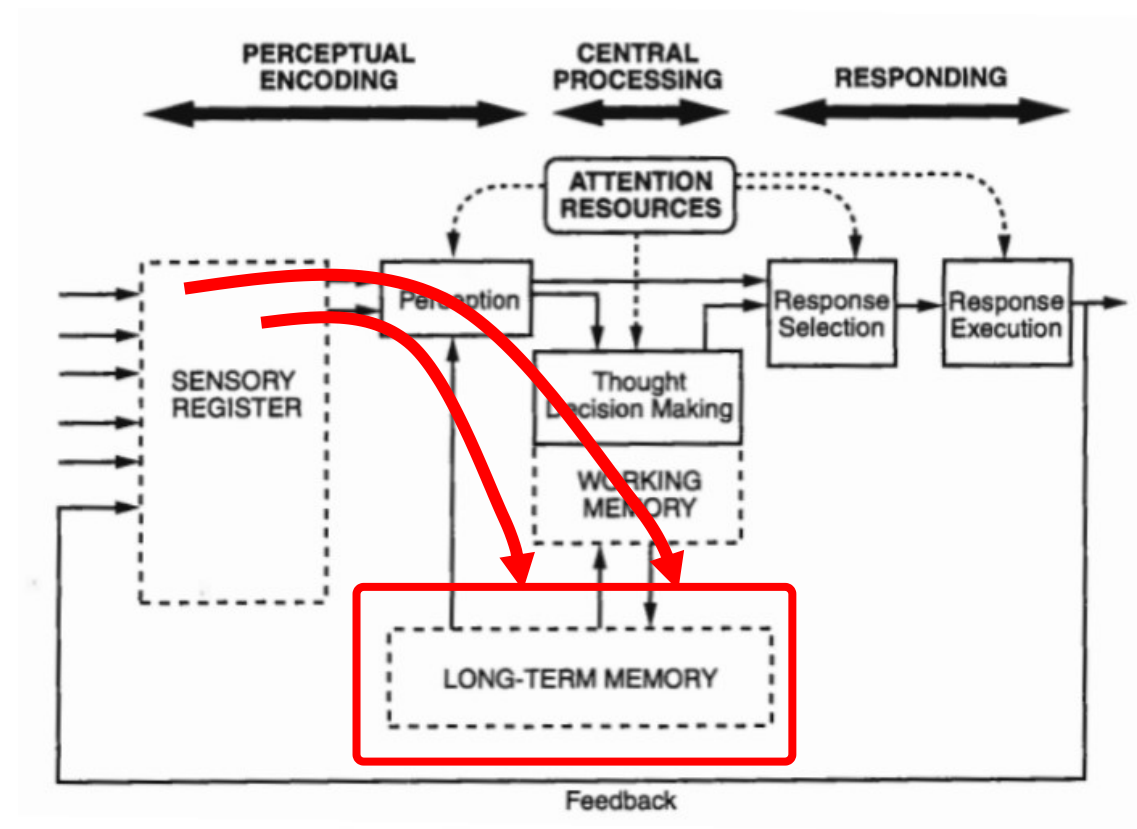

□ **Recognition** = fast; based on familiarity and perception

□ **Recall** = typically slower; deeper retrieval process

Why is Recognition So Much Easier?

- Perception is processed → patterns of neural activity are created
- When a new perception arrives similar to an earlier one, it re-stimulates the existing pattern without processing by Working Memory => sense of recognition

Recall Seems Harder, but We Do OK

- ❑ Recall requires accessing memories **without** immediately similar perceptions
- ❑ We store a vast amount of information—1 million gigabytes—so recalling anything is kind of astonishing

(Reber, P. 2010. www.scientificamerican.com/article/what-is-the-memory-capacity)

Implications of Recognition for Design

Reminder images and text provide recognition, and are easier to process than recall is.

*Include **Recently Viewed Items** functionality often and creatively*

Your Recently Viewed Items

Baxton Studio Dario Red Plastic Mid-Century Modern Rocking Chair

~~\$160.00~~
\$108.00
Save: 33%

Samsung WE357A0P 15" Laundry Pedestal with 26 lbs. Capacity

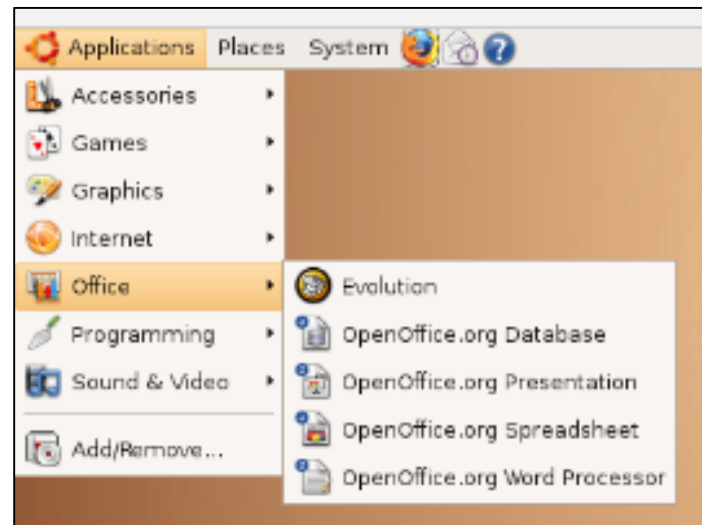

~~\$279.99~~
\$276.99

Implications of Recognition for Design

- ❑ Avoid instances of pure recall in favor of recognition.

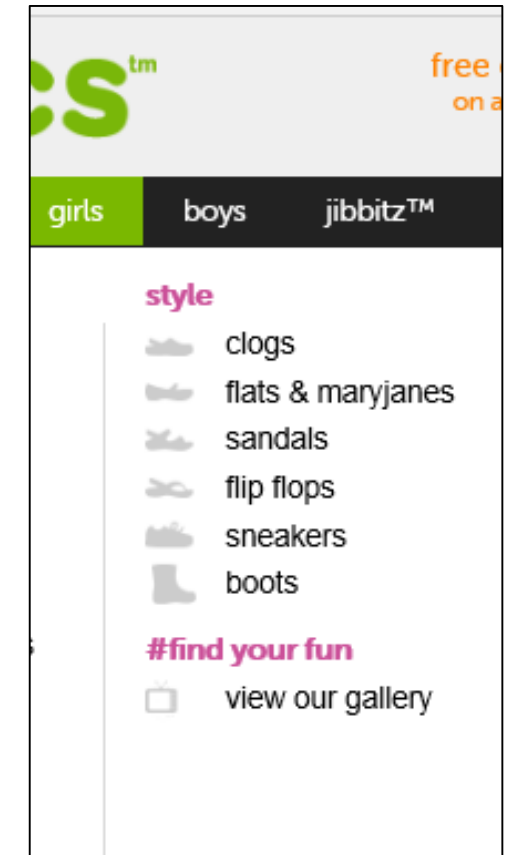

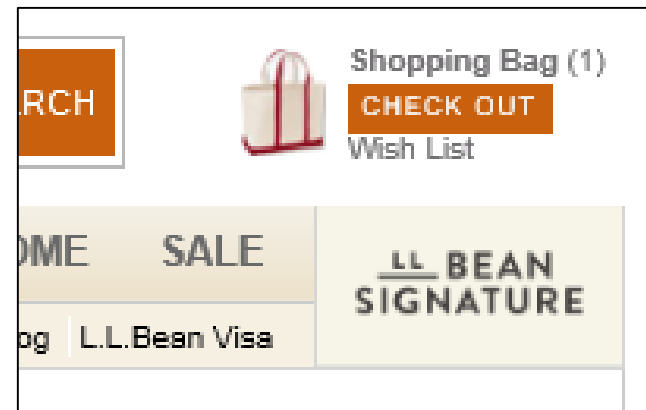

*Use menus over
command lines*

Implications of Recognition for Design

- Use pictures or icons for functions, (along with text labels).

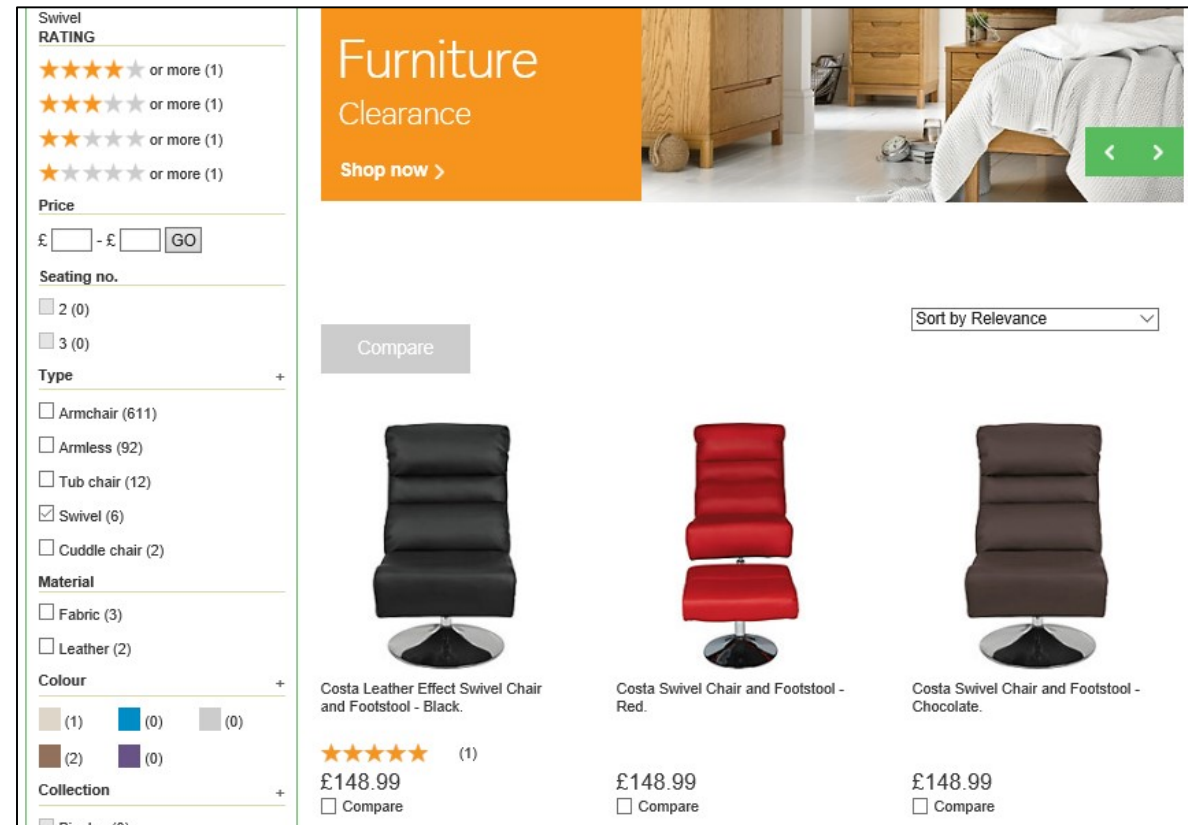

Make sure they're easy to differentiate and understand.

Implications of Recognition for Design

- ❑ Leverage smaller “thumbnail” images to help people navigate.

Provide images at a sufficient size so people can easily ‘read’ them on product listing pages, confirmation pages, shopping carts, and Support pages.

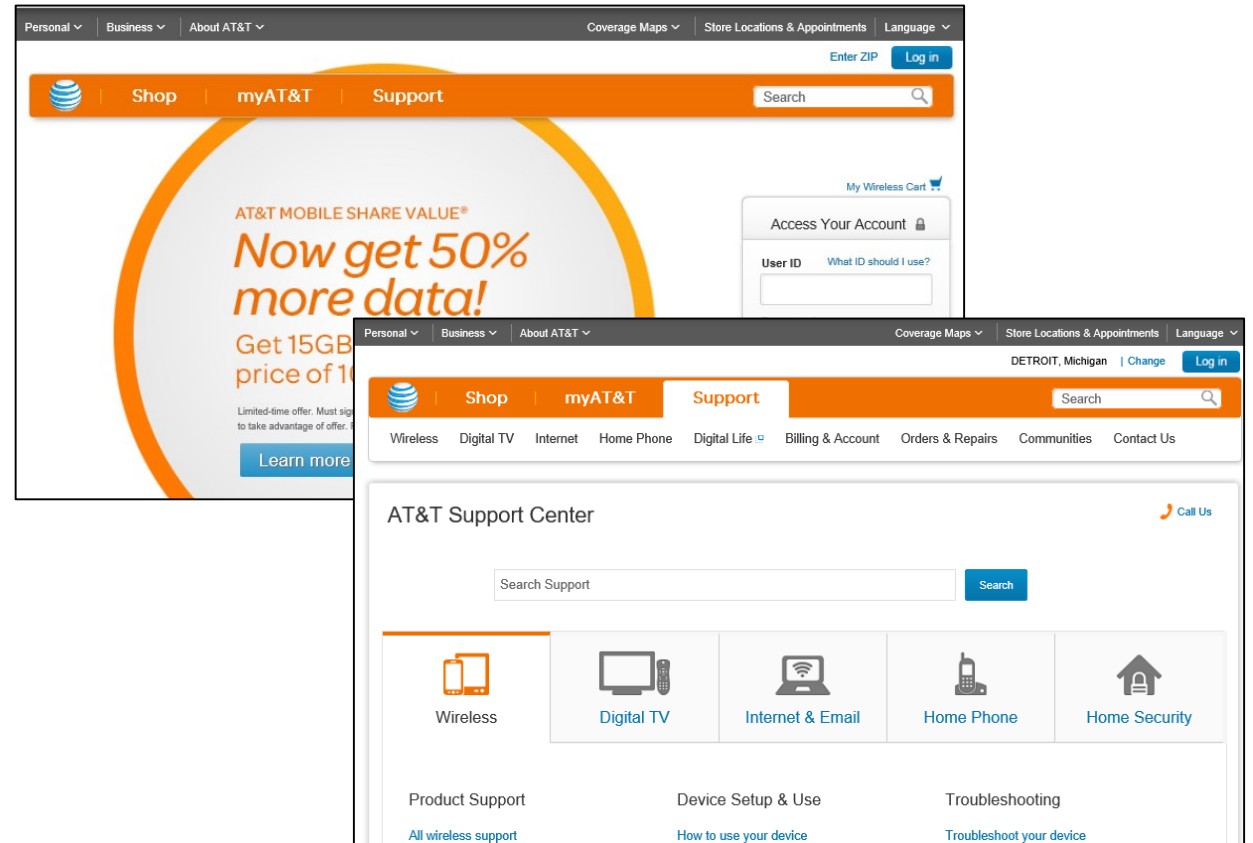

Implications of Recognition for Design

- Reassure people they are still on your site – or that they have returned to the right one.

Maintain consistent look and feel and navigation options, so it's all visually familiar.

And...

Implications of Recognition for Design

- ❑ Give them some **conventional** forewarning icon if a link is going to take them to a:
 - ❑ Different site or
 - ❑ Open a PDF or some other kind of file.

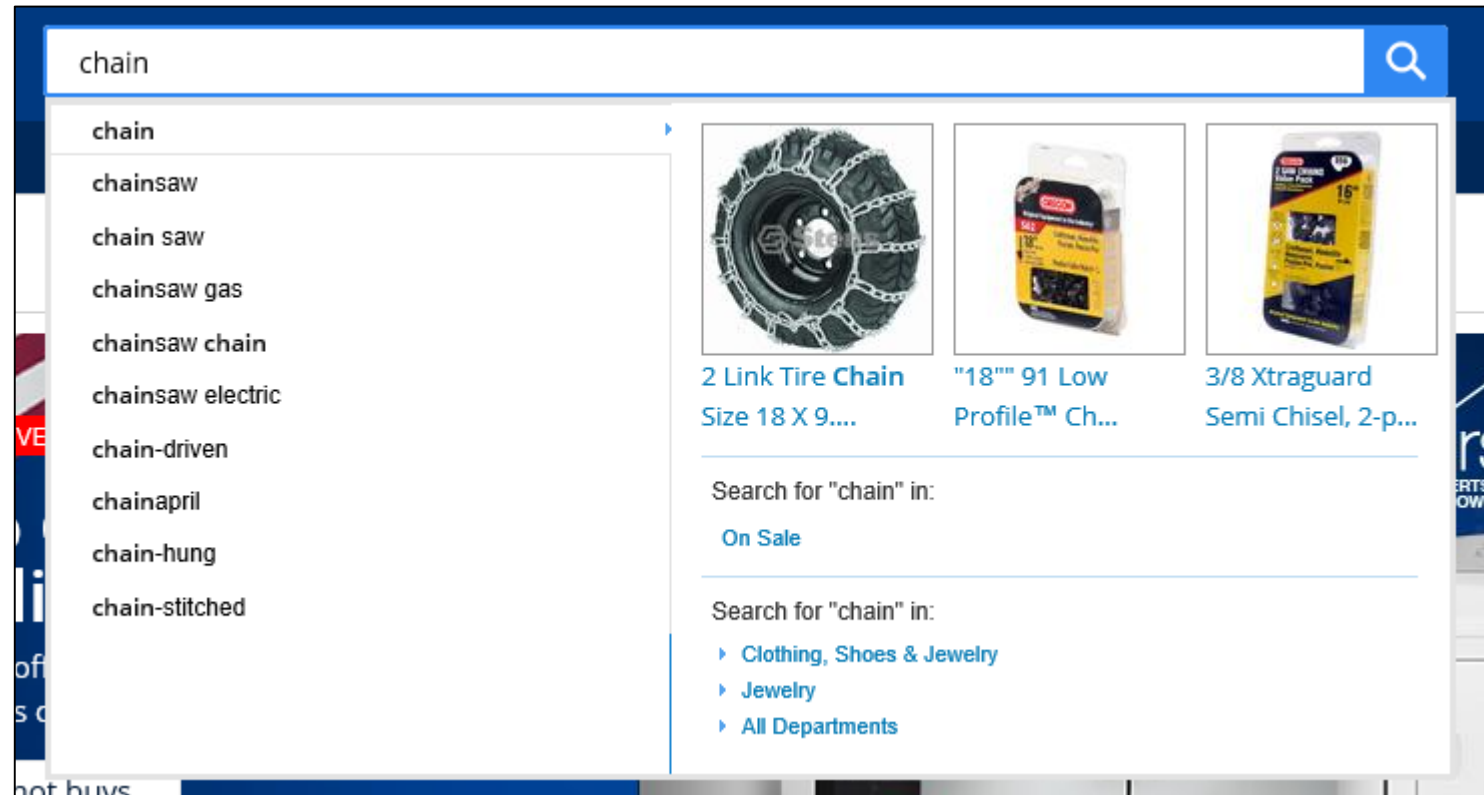

Also! Display icons and/or the new URL with the link, so there isn't a jarring arrival on a different site.

- [Insurance Overview](#)  [110.45 KB]
- [Health Insurance Overview](#)  [63.19 KB]
- [FastFacts](#)
- [Compare Health Plans](#)
- [Compare Dental and/or Vision Plans](#)
- [Flexible Spending Calculator](#) 
- [Agency Contact Information](#)
- [Health Brochures](#)
- [Dental Brochures](#)
- [Vision Brochures](#)
- [Prospective Health Plan Carriers](#)

Implications of Recognition for Design

- Help visitors with suggested terms that your site uses.

*Provide
autocomplete and
autosuggest to
provide options for
users*

Procedural Memory

- ❑ **Implicit memory** = memory without conscious awareness
- ❑ One form is **procedural memory** = memory for the ability to **do** something without thinking
- ❑ Examples: Riding bike, driving, typing, brushing teeth, almost any activity that has been so practiced as to become an **Automatic Process**
- ❑ Very key example is *mobile gestures*

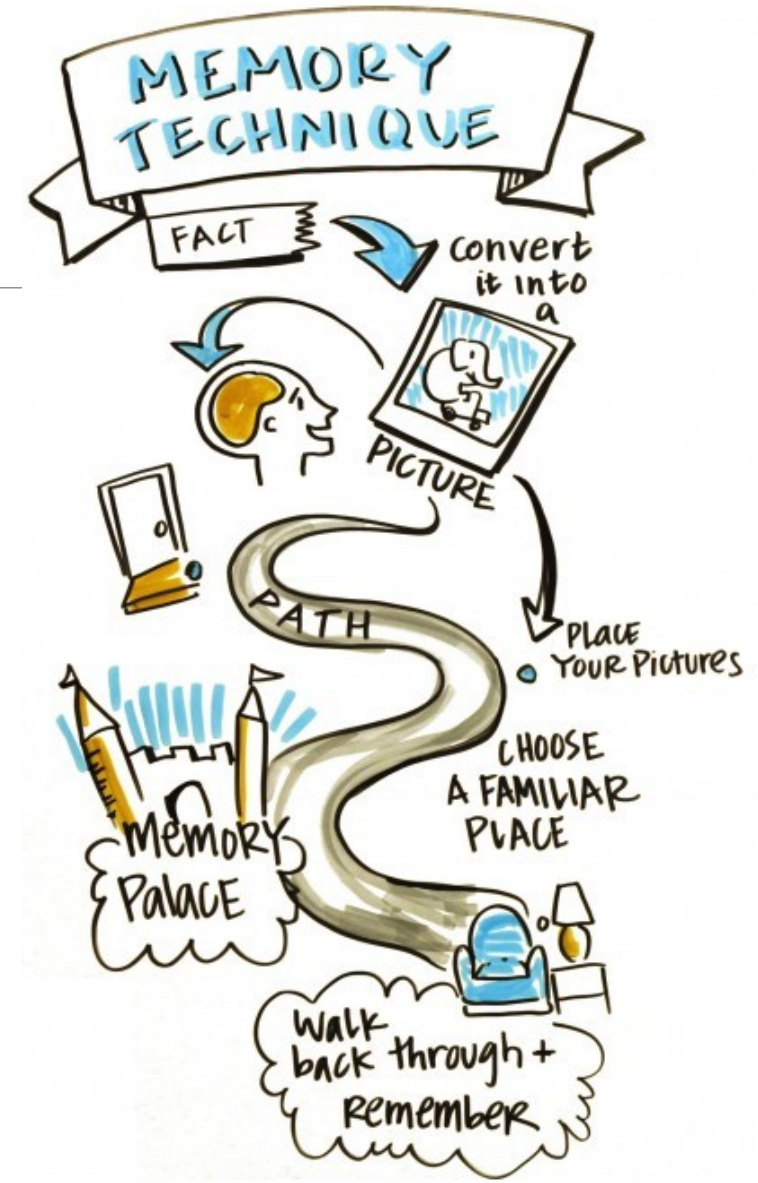

<https://dribbble.com/shots/1231231-Mobile-Gestures-vector-free-gif>

Not an HCI concept

Method of Loci

- ❑ Useful technique for recalling an ordered sequence of item
- ❑ Mentally created locations “contain” items
- ❑ To recall, “walk through” the space
- ❑ Why it works:
 - Imposes organization on unorganized list
 - Creating associations between locations and items is *elaborative (deep) processing*

Remembering Everything Would Be Bad

- ❑ Weinschenk chapter, “It’s a Good Thing That People Forget”
- ❑ *Forgetting isn’t a bug, it’s a feature*
- ❑ *We would not be able to function if every memory were accessible*
- ❑ *So we live with it ... and design for it*

<http://www.scientificamerican.com/article/trying-to-forget/>

Summary

- ❑ Time and interference are determiners of memory decay (forgetting)
- ❑ Recognition is easier and faster than recall
- ❑ Memories for doing actions—procedural memory—are stored in LTM
- ❑ UIs can do much to accommodate human memory limits
